

Product Management — Learn It Tonight, Ace It Tomorrow

Built from all 20 decks in this folder. Everything a slide taught is rebuilt here in plain English with Indian app examples. You will never have to open a slide.

□ The Big Picture (Read This First)

Imagine you are opening Swiggy at 9 pm on a Friday. You're hungry. You don't care about Swiggy's "app architecture" or "microservices" or "growth strategy." You just want biryani in 30 minutes. Product Management (PM) is the job of making sure that — from the moment you open the app to the second you bite the biryani — *someone* has thought about every tap, every nudge, every delay, and every disappointment.

Product Management is the discipline of deciding what to build, why to build it, for whom, when, and how you'll know it worked — so that it creates real value for users AND makes money for the business. A Product Manager (PM) is not a boss, not a designer, not an engineer. A PM is the person who connects three worlds: the **User** (what they want), the **Business** (how the company makes money), and the **Tech/Design team** (what can actually be built).

The Story That Ties Everything Together

Every PM story, from a tiny feature to a full company, follows the same arc. Learn this arc and every topic in this course falls into place:

1. **Why does this product exist?** → *Strategy, Vision, Mission, Business Model* (Sessions: Intro, Strategy, Business Models). You pick a **Market** and decide how you'll make money.
2. **Who is it for?** → *Customers, Segments, ICP, Personas, Market Sizing TAM/SAM/SOM* (Session 3). You narrow the universe.
3. **What problem are we solving for them?** → *Product Thinking, Jobs-To-Be-Done, Pain points* (Session 2). You discover unmet needs.
4. **How is the space today?** → *Competitive Landscape, Positioning, CRM* (Session 4). You pick where you'll win.
5. **How do we learn what's true?** → *Qualitative + Quantitative Research, Surveys, Analytics* (Sessions 5–6). You gather evidence.
6. **How do we measure success?** → *Metrics, North Star, HEART, AARRR, A/B Testing* (Session 7). You pick numbers.
7. **How do we reduce risk before building?** → *Discovery, MVPs, Hypotheses, Validation* (Session 10).
8. **What do we build first?** → *Prioritization (RICE, Kano, WSJF), Stakeholders, Decision Memos* (Session 11).
9. **How do we align everyone?** → *OKRs* (Session 12).
10. **How do we write it down and build it well?** → *PRDs, UX, Collaboration, Quality* (Session 13).

11. **How do we ship safely?** → *Delivery, Releases, Feature Flags, Experiments, Incidents, Ops* (Session 14 / Delivery deck).
12. **What special cases exist?** → *Enterprise, Platforms, APIs* (Session 15).
13. **How do we launch and keep growing?** → *GTM, PMF, Growth, Retention, Post-Launch* (Session 16 / GTM deck).
14. **How do we price it?** → *Business Models, Pricing, Packaging* (Pricing deck).

The mental model: PM is a *loop*, not a line. You **Discover** → **Define** → **Design** → **Deliver** → **Measure** → **Learn** → **Discover again**. Everything you'll study maps to one of those five verbs. Outputs (features shipped) don't matter; **Outcomes** (users helped, money earned) do.

One more cornerstone: A PM's superpower is not authority. PMs almost never have direct authority over designers or engineers. They lead through **influence, evidence, and clarity of thinking**. That is why we study Research, Memos, Stakeholders, and OKRs — they are tools of influence.

Topic 1: What Product Management Actually Is □

□ Understand It (The "Why")

Think of Zomato. When you open it, someone decided: "Show restaurants sorted by distance, not by rating." That decision wasn't made by a coder or a designer alone. It was made by a **Product Manager** who looked at data (people abandon orders when restaurants are far), spoke to users ("I want fast delivery"), checked business goals (reduce cancellation rate), and then told the team: "Let's sort by distance." Product Management is exactly that: the art of deciding *what* to build, *for whom*, *why*, and *when*, so the product solves a real problem and makes money.

□ The Framework — The PM Venn Diagram

A PM lives at the center of User + Business + Tech. Miss any one corner and the product fails.

□ Outputs vs Outcomes

Aspect	Output	Outcome
What	A feature shipped	A behavior/result changed
Example	"Launched UPI button"	"30% more payments completed"
Measures	Lines of code, releases	Retention, revenue, NPS
A good PM optimizes for...	□	□

□ Key Terms

- **PM (Product Manager):** Owner of the **why** and **what** of a product.
- **PO (Product Owner):** Scrum role that owns the **backlog**; often narrower, execution-focused.
- **PMM (Product Marketing Manager):** Owns positioning, launch, messaging — the *go-to-market* side.
- **Backlog:** The ordered list of things to build.
- **Roadmap:** The time-horizon plan (Now / Next / Later).
- **Stakeholder:** Anyone affected by or affecting the product — engineering, sales, leadership, legal, customers.
- **Artifacts:** Documents a PM produces — PRDs, roadmaps, memos, specs.

□ What PM is NOT

- Not a CEO of the product (they don't give orders).
- Not a project manager (that's timelines & tickets).
- Not a designer, not an engineer.
- Not someone who just "writes tickets."

□ How It Connects

This is the root. Everything — research, prioritization, metrics, OKRs, launch — is a tool a PM uses. Understanding what PM is is the lens for every other topic.

⚠ Where Students Lose Marks

- Confusing **output** with **outcome**. If your answer says "success = 10 features shipped," you lose marks. Success = user/business impact.
- Calling PM a "boss." PMs lead without authority.
- Confusing PM vs PO vs PMM. PM = why/what. PO = backlog. PMM = launch/positioning.

□ If You Only Remember 3 Things

1. PM = intersection of **User Desirability + Business Viability + Tech Feasibility**.
 2. Outcomes over Outputs.
 3. PMs lead through **influence + evidence**, not authority.
-

Topic 2: Product Thinking & Jobs-To-Be-Done (JTBD) □

□ Understand It (The "Why")

When you "hire" Ola at 11 pm, you're not buying a cab. You are hiring Ola to do the **job** of "getting me home safely without arguing with autos." The same person at 2 pm might "hire" the metro for "reach office on time + cheap." The product is a *means*; the *job* is the real reason. This is the heart of **Jobs-To-Be-Done (JTBD)**.

Product thinking means: stop asking "What feature do users want?" and start asking "What progress are they trying to make in their life?"

□ The JTBD Statement (Framework)

"When [situation], I want to [motivation], so I can [expected outcome]."

Example: "When I'm hungry and lazy on a Sunday, I want to order food in under 30 minutes, so I can eat without leaving my couch." → That's why Swiggy exists.

□ Functional vs Emotional vs Social Jobs

Type	Question	Example (CRED)
Functional	What practical task?	Pay credit-card bill
Emotional	How do they want to feel?	Feel rewarded, elite
Social	How do they want to be seen?	"I use CRED, I'm premium"

□ User Empathy Tools

1. **Empathy Map** — Says / Thinks / Does / Feels quadrants.
2. **Persona** — Semi-fictional profile (e.g., "Riya, 24, Mumbai, new grad, orders Zomato 4x/week").
3. **Customer Journey Map** — Steps a user takes, emotions at each step, pain points.

□ Key Terms

- **Pain Point**: A problem or friction the user feels.
- **Use Case**: A specific scenario of use.
- **Value Proposition**: The clear promise of value you make to a user.
- **Pain × Frequency × Willingness-to-Pay**: Lens to judge if a problem is worth solving.

□ How It Connects

JTBD → drives your **Segmentation** (who has this job?) → drives **Positioning** (how do we fit their job better than competition?) → drives **Features** (what actually delivers the job?).

⚠ Where Students Lose Marks

- Confusing features with jobs. "Dark mode" is a feature, not a job.

- Writing vague JTBD statements without *situation + motivation + outcome*.
- Ignoring emotional + social jobs.

□ If You Only Remember 3 Things

1. Users "hire" products to do jobs; features are means, not ends.
2. Every job has Functional + Emotional + Social layers.
3. Use the JTBD sentence: "When , *I want* , so I can ____."

Topic 3: Customers, Segments, Personas & Market Sizing (TAM/ SAM/SOM) □

□ Understand It (The "Why")

If you told me you're opening a dosa stall, my first question is: *in which city, on which street, for which kind of eater?* "Everyone" is not a customer. A PM narrows "everyone on earth" down to "this specific person with this specific problem who will pay me this much." That's **segmentation + market sizing**.

□ TAM / SAM / SOM (The Three Circles)

- **TAM (Total Addressable Market)** = Total demand if everyone in the world bought it. *Example (Swiggy): all food-ordering spend in India = ₹5 lakh crore.*
- **SAM (Serviceable Addressable Market)** = The portion Swiggy can realistically serve (cities they deliver in, online-ordering population). Maybe ₹1 lakh crore.
- **SOM (Serviceable Obtainable Market)** = The slice they can actually capture in 1–3 years given competition and budget. Maybe ₹15,000 crore.

□ How to Calculate (Two Approaches)

Approach	What	Example
Top-Down	Start with industry reports, filter down	"India online food market = ₹2L cr; 20% metro-urban = ₹40K cr"
Bottom-Up	Start with units × price × users	"50M users × 4 orders/mo × ₹300 avg = ₹72K cr/yr"
<i>Bottom-up is always preferred by examiners — it shows reasoning.</i>		

□ ICP (Ideal Customer Profile) vs Persona

- **ICP** (B2B) = The *company* you sell to. E.g., "Indian D2C brand, 50–500 employees, ₹20Cr–₹200Cr revenue, using Shopify."
- **Persona** (B2C) = The *person*. E.g., "Riya, 24, Mumbai, marketing exec, orders 4x/week, loves discounts."

□ Segmentation Criteria

Type	Example
Demographic	Age, gender, income
Geographic	City tier, region
Psychographic	Values, lifestyle
Behavioral	Usage frequency, loyalty
Firmographic (B2B)	Industry, size, tech stack

□ Key Terms

- **TAM/SAM/SOM** — the three market sizes above.
- **ICP** — Ideal Customer Profile.
- **Segment** — a group of customers with similar needs.
- **Persona** — a semi-fictional archetype.

□ How It Connects

Segment → decides who to research (Session 5/6) → shapes Positioning (Session 4) → determines Pricing tiers (Pricing deck) → chooses Launch channel (GTM).

⚠ Where Students Lose Marks

- Using TAM numbers alone — examiner wants all three.
- Forgetting **bottom-up** derivation.
- Confusing ICP and Persona.
- Giving segments without a "so what" (what do we do differently for each?).

□ If You Only Remember 3 Things

1. TAM > SAM > SOM (always in that nesting order).
 2. Bottom-up sizing = users × frequency × price.
 3. A segment is only useful if it changes what you do for them.
-

Topic 4: Competitive Landscape, CRM & Positioning □

□ Understand It (The "Why")

Why does PhonePe exist when Paytm was there first? Because PhonePe *positioned* itself as "UPI-first, simple, no-wallet nonsense." Positioning is the answer to: "*In the user's mind, where do you sit, compared to every other option?*" If you don't pick a position, the user picks one for you — usually not flattering.

□ Competitive Analysis 2×2 Matrix

Price (low → high)		
	Low Price	High Price
Feature-rich	Swiggy	Zomato Gold
Feature-lite	Thrive	EatClub

Plot competitors by any two axes that matter: *price vs quality, speed vs variety, DIY vs full-service*.

□ The Positioning Statement (5 Components)

For [target customer], who [need/problem], our product is a [category] that [key benefit], unlike [competitor], because [differentiator].

Example: *For busy urban professionals who need quick, healthy meals (1), CureFoods is a cloud-kitchen network (2) that delivers chef-prepared diet food in 30 minutes (3), unlike Swiggy which aggregates restaurants (4), because we own the kitchens and the nutritionists (5).*

□ SWOT

Strengths (internal +)	Weaknesses (internal –)
Opportunities (external +)	Threats (external –)

□ Porter's Five Forces (for competitive landscape)

1. Threat of new entrants
2. Bargaining power of suppliers
3. Bargaining power of buyers
4. Threat of substitutes
5. Rivalry among existing competitors

□ Key Terms

- **Positioning:** the place you want to own in the user's mind.
- **CRM (Customer Relationship Management):** systems + processes to manage customer data & interactions (Salesforce, HubSpot, Zoho).
- **Competitive Moat:** a durable advantage — network effects, brand, scale, IP.

- **Category Design:** creating a *new* category so you're the default (e.g., CRED = "rewards for paying bills").

□ How It Connects

Positioning builds on Segmentation (who) + JTBD (job) → feeds Messaging + GTM (how we talk) → informs Pricing (signal).

⚠ Where Students Lose Marks

- Writing positioning statements without the "unlike / because" part.
- Listing competitors without plotting on axes that matter.
- Confusing positioning (perception) with features (reality).

□ If You Only Remember 3 Things

1. Positioning = For X, who Y, we are Z, unlike A, because B.
2. Use a 2×2 on the two axes that matter *to your user*.
3. Moats are durable: network effects, brand, scale, switching costs.

Topic 5: Qualitative Research & Insight Synthesis □

□ Understand It (The "Why")

When Flipkart wanted to understand why Tier-3 users abandoned carts, they didn't run a survey — they sat in users' homes and watched them shop. That's **qualitative research**: small samples, deep understanding, emotional context. Numbers tell you *what*; qualitative tells you *why*.

□ Qualitative Methods

Method	Best For	Sample Size
1:1 User Interviews	Motivations, pain points	5–10
Contextual Inquiry / Ethnography	Real-world usage	3–6
Focus Groups	Social reactions	6–8 per group
Usability Testing	Task friction	5 users catches ~80% issues
Diary Studies	Behavior over time	8–12 users, 1–2 weeks

□ The Good Interview (Rules)

1. Ask about **past behavior**, not future intent ("Tell me about the last time you ordered food" > "Would you use this feature?")
2. **Open-ended** questions ("Walk me through...")
3. **Never pitch your idea.** Your job is to listen.
4. **The Mom Test** — if even your mom couldn't lie to you, it's a good question.
5. Follow pain with curiosity — "Tell me more about that."

□ Insight Synthesis — From Notes to Insights

Raw Notes → Affinity Diagram → Themes → Insights → Opportunities
(quotes) (group by topic) (pattern) ("aha!") (what to do)

An **insight** is: "Users abandon cart not because of price but because of *delivery uncertainty*." Not "users want faster delivery."

□ Key Terms

- **Affinity Mapping**: sticky-note clustering to find themes.
- **Verbatim**: direct user quote (powerful evidence).
- **Insight**: a surprising, decision-changing observation.
- **Bias**: confirmation, leading, social desirability — things that corrupt qualitative data.

□ How It Connects

Qualitative fuels **hypotheses** → tested with **quantitative** (surveys, A/B tests) → inform **product decisions** (PRDs, prioritization).

⚠ Where Students Lose Marks

- Citing surveys as qualitative. (Surveys are quantitative.)
- Confusing an observation with an insight.
- Forgetting that 5 users catches most usability issues (Nielsen).

□ If You Only Remember 3 Things

1. Qualitative = *why*; Quantitative = *what*.
2. Ask about past behavior, never future intent.
3. Insight = a pattern that changes what you build.

Topic 6: Quantitative Research, Surveys & Analytics Foundations □

□ Understand It (The "Why")

After watching 10 Flipkart users, you have theories. To know whether those theories hold for 10 million users, you need **numbers**: surveys, funnels, cohorts, dashboards.

□ Survey Design Rules

1. **One question at a time** (no "How easy and fast was checkout?" — split it).
2. **Neutral wording** (no "How amazing was our service?")
3. **Balanced scales** (Likert 1–5 with neutral middle).
4. **Short** (5 min max).
5. **Randomize options** to kill order bias.

□ Sampling

Type	Definition	When to Use
Random	Every user equal chance	Population inference
Stratified	Divided by segment, sample each	Segment comparisons
Convenience	Whoever's available	Exploration only (not publishable)
Purposive	Specific criteria	Deep specific segment

Rule of thumb: $n \geq 30$ for basic stats; $n \geq 385$ for 95% confidence $\pm 5\%$ margin.

□ Common Survey Questions

- **NPS (Net Promoter Score):** "How likely are you to recommend us (0–10)?" → Promoters (9–10) – Detractors (0–6).
- **CSAT (Customer Satisfaction):** "How satisfied?" (1–5).
- **CES (Customer Effort Score):** "How easy?" (1–7).

□ Analytics Stack (for a PM)

Instrumentation → Collection → Storage → Analysis → Dashboard → Decision
(SDK in app) (Segment) (Warehouse) (SQL) (Amplitude) (PM action)

□ Key Metric Types

- **Counts** (DAU, MAU, orders)
- **Ratios** (conversion, retention)
- **Distributions** (session length percentiles)
- **Cohorts** (users who joined same week, tracked over time)

□ Key Terms

- **DAU/MAU:** Daily/Monthly Active Users.
- **Stickiness = DAU/MAU** (0.2 = visits ~6 days/month).
- **Cohort:** group of users with shared start time.
- **Statistical significance (p-value):** probability result is not luck; usually $p < 0.05$.
- **Confidence Interval:** range a true value likely lies in.

□ How It Connects

Quant validates Qual → feeds **Metrics & North Star** (Topic 7) → powers **A/B testing** → informs **Prioritization**.

⚠ Where Students Lose Marks

- Leading/double-barrel survey questions.
- Too-small samples for population claims.
- Confusing correlation with causation.

- Forgetting to randomize.

❑ If You Only Remember 3 Things

1. One question, neutral wording, balanced scale.
2. Cohort > snapshot for retention.
3. Quant confirms; qual inspires.

Topic 7: Metrics, North Star, HEART, AARRR & A/B Testing ☐☐☐

❑ Understand It (The "Why")

If you don't know what you're optimizing, you can't win. Metrics are the scoreboard. But the wrong metric (e.g., "pageviews") can kill a company (users pogo-sticking through ads = bad UX). That's why every product picks **one North Star** — the single number that captures value.

❑ The North Star Metric (NSM)

Definition: **The one metric that best captures the core value customers get from your product.**

Examples: | Product | North Star | |---|---| | Swiggy | Successful orders delivered/day | | Zomato | Monthly dine-out bookings | | Spotify | Time spent listening | | Airbnb | Nights booked | | WhatsApp | Messages sent/day | | Netflix | Hours watched/week |

The NSM has **Input Metrics** (levers you can pull) that drive it. E.g., Swiggy NSM "orders/day" inputs: restaurant count, delivery time, conversion, retention.

❑ AARRR — The Pirate Funnel

A cquisition	→ How do users find you?	(installs, signups)
A ctivation	→ First "aha!" moment	(first order, profile complete)
R etention	→ Do they come back?	(D7, D30 retention)
R eferral	→ Do they invite others?	(K-factor, viral loop)
R evenue	→ Do they pay?	(ARPU, LTV)

Also called "pirate metrics" because AARRR sounds like a pirate.

❑ HEART Framework (Google)

Metric	Measures	Example
Happiness	Satisfaction	NPS, CSAT
Engagement	Depth of use	Sessions/user
Adoption	New users	Signup rate
Retention	Returning users	D30 retention
Task Success	Completion	Checkout rate

□ Metric Hygiene — Vanity vs Actionable

- **Vanity metrics:** big numbers that look good but don't drive decisions (total signups, pageviews).
- **Actionable metrics:** move with cause (7-day retention, cart → purchase conversion).

□ Leading vs Lagging

- **Leading:** predicts future (e.g., "onboarding completion" predicts retention).
- **Lagging:** confirms past (e.g., "MRR").

□ A/B Testing — The Experimentation Workflow

1. HYPOTHESIS → "Changing CTA 'Buy' to 'Order Now' will lift conversion by 2%"
2. METRIC → primary: conversion; guardrails: refund rate, load time
3. VARIANTS → Control (A) vs Treatment (B)
4. SAMPLE SIZE → MDE (min detectable effect), power 0.8, α 0.05
5. RANDOMIZATION → bucket users randomly (user-level, not session)
6. RUN → hit sample size, do NOT peek
7. ANALYZE → significance + effect size + confidence interval
8. DECIDE → ship / kill / iterate

□ A/B Testing Pitfalls

- **Peeking:** calling result early before sample size.
- **Novelty effect:** new things always look better initially.
- **Sample ratio mismatch (SRM):** traffic split didn't actually happen 50/50.
- **Simpson's paradox:** overall wins but loses in every segment.
- **Not logging guardrails:** you lifted conversion 2% but crashed page-load time.

□ Key Terms

- **NSM, AARRR, HEART** — above.
- **MDE:** Minimum Detectable Effect.
- **p-value < 0.05:** 95% confidence not chance.
- **MRR / ARR:** Monthly/Annual Recurring Revenue.
- **LTV:** Lifetime Value.
- **CAC:** Customer Acquisition Cost.
- **LTV/CAC > 3:** healthy SaaS economics.
- **Payback period:** months to recover CAC.
- **Stickiness DAU/MAU.**
- **Cohort retention curve** — flattens = PMF signal.
- **Guardrail metrics:** things that must not break.

□ How It Connects

Metrics ← Discovery/Validation (what to test) → A/B tests → Experimentation Ops (Delivery deck) → Post-Launch (GTM).

⚠ Where Students Lose Marks

- Picking vanity metrics (total signups) as NSM.
- Forgetting guardrail metrics.
- Running A/B tests without pre-declared hypothesis + sample size.
- Confusing leading vs lagging.
- Forgetting HEART letters or AARRR letters.

□ If You Only Remember 3 Things

1. One North Star; AARRR is the funnel; HEART is for UX.
2. A/B test needs hypothesis, sample size, guardrails, no peeking.
3. LTV/CAC > 3 and retention-curve flattening = healthy.

Topic 8: Strategy, Business Case, Portfolio & Kill Criteria □

□ Understand It (The "Why")

Every company has limited money and people. "Strategy" is the logic that decides what to *not* do. Before a PM pitches a bet, they write a **business case** — a short argument with costs, benefits, risks, kill criteria. Without it, projects zombie-walk through quarters.

□ Strategy Pyramid

□ The Business Case (1-Pager)

1. **Problem & context** — who, what pain.
2. **Opportunity size** — TAM/SAM/SOM.
3. **Proposed solution** — high-level.
4. **Expected outcome** — metric lift, revenue impact.
5. **Costs** — people, infra, opportunity cost.
6. **Risks & mitigations**.
7. **Kill criteria** — "If by week X metric Y is below Z, we stop."
8. **Decision asked** — what you need (budget, sign-off).

□ Portfolio Management (3 Horizons — McKinsey)

Horizon	Timeframe	Investment
H1	Core — grow existing	70%
H2	Adjacent — expand	20%
H3	Transformational — bets	10%

□ Kill Criteria

A **pre-declared** threshold (metric + time) at which a bet is stopped — no emotions, no sunk-cost fallacy.
Example: *"If after 8 weeks of launch in Bengaluru, D7 retention is below 15%, we kill the feature."*

□ Build vs Buy vs Partner

Dimension	Build	Buy	Partner
Control	High	Low	Medium
Speed	Slow	Fast	Medium
Cost	High fixed	High variable	Shared
Differentiation	Your IP	Commodity	Co-branded

□ Key Terms

- **Vision / Mission / Strategy:** the why, what, how levels.
- **Business case:** short decision document.
- **Kill criteria:** pre-declared stop-condition.
- **Portfolio:** mix of bets across horizons.
- **Opportunity cost:** the value of what you *didn't* do.

□ How It Connects

Strategy sets goals → OKRs (Topic 14) cascade them → Prioritization (Topic 11) picks which → PRDs (Topic 13) execute.

⚠ Where Students Lose Marks

- Writing a business case without kill criteria.
- Confusing vision with strategy.
- Ignoring opportunity cost.

□ If You Only Remember 3 Things

1. Strategy = choosing what NOT to do.
 2. Every business case has kill criteria, pre-declared.
 3. 70/20/10 across H1/H2/H3.
-

Topic 9: Business Models, Pricing & Packaging □

□ Understand It (The "Why")

Swiggy charges a delivery fee. Netflix charges subscription. Google shows ads. UPI is free. Different **business models** encode how value turns into money. Within a model, **pricing** = how much, **packaging** = what's bundled into which plan. Get pricing wrong and you leave crores on the table or scare buyers away.

□ The 3-Layer Stack

Layer	Question	Example (Netflix)
Business Model	How does money flow?	Subscription
Pricing	How much, on what metric?	₹149–₹649/month per screen count
Packaging	What's in which plan?	Mobile / Basic / Standard / Premium

□ Common Business Models

Model	Example	Good For
Subscription	Netflix, Spotify	Recurring value
Transaction Fee	Swiggy, Razorpay	Marketplace, payments
Marketplace/Commission	Zomato, Flipkart	Two-sided networks
Usage-based (UBP)	AWS, Twilio	Variable consumption
Freemium	LinkedIn, Canva	Land then expand
Advertising	Google, Facebook	Massive attention
Licensing	Windows	One-off / enterprise
Razor-Blade	Gillette, Kindle	Core + consumables

□ Pricing Strategies

Strategy	Anchor	Example
Cost-plus	Cost + margin	Physical goods
Competitor-based	Rival price	Airlines
Value-based	ROI to buyer	Enterprise SaaS
Penetration	Low to enter	JioMart launch
Premium / Skimming	High signals quality	Apple
Dynamic	Varies by demand	Uber surge
Hybrid	Mix (base + usage)	AWS, Zoom

□ SaaS Tiering (Good / Better / Best)

Starter	Growth	Enterprise
₹999/mo	₹2,999/mo	Custom
Core seats	+ Analytics	+ SSO, SLA
Solo	Team	Company

Entry → Expansion → Deep Money

Rules: 3 tiers ideal (Goldilocks), clear jump between tiers, gate only *features that matter to that segment*.

□ Freemium Mechanics

- Free tier must deliver **real** value (not bait).
- Paid tier must deliver **10x** value.
- Conversion benchmark: 2–5% free → paid.
- Watch for cannibalization (free too good).

□ Pricing Psychology

- **Anchoring:** show high price first → makes other tiers feel cheap.
- **Decoy effect:** add a useless middle tier to push people up.
- **Charm pricing:** ₹499 feels much less than ₹500.
- **Framing:** "₹299/mo" > "₹3,588/yr."

□ Usage-Based Pricing (UBP)

Charge per API call / GB / transaction. Great for aligning cost-to-value but creates **bill shock**. Guardrails: caps, alerts, commit tiers.

□ Key Terms

- **MRR/ARR:** monthly/annual recurring revenue.
- **ARPU:** average revenue per user.
- **Expansion / Upsell / Cross-sell.**
- **Grandfathering:** old customers keep old price.
- **Willingness to pay (WTP):** max a customer will pay.

□ How It Connects

Pricing is downstream of Positioning + Segmentation, upstream of GTM + Growth.

⚠ Where Students Lose Marks

- Confusing model vs pricing vs packaging.
- Picking pricing metric that doesn't scale with value.
- Ignoring cost-to-serve (freemium death).
- Not building guardrails for UBP.

□ If You Only Remember 3 Things

1. 3 layers: Model (how money flows) / Pricing (how much) / Packaging (what's in).
2. Value-based pricing > cost-plus for software.
3. 3-tier SaaS with real differentiation = winning packaging.

Topic 10: Discovery & Validation (MVPs, Hypotheses, Experiments) □

□ Understand It (The "Why")

Building the wrong thing is 1,000× more expensive than testing the wrong thing. **Discovery** = learning what's true *before* you build. Validation = proving a risky assumption is safe before committing engineers.

□ Discovery Mode vs Delivery Mode

Mode	Purpose	Output
Discovery	Reduce uncertainty	Validated insight
Delivery	Ship reliably	Working software
<i>They have different operating systems — don't run them the same.</i>		

□ The Assumption Map (Risk Triangle)

Every idea has risks in all three. Map assumptions, rank by **criticality + uncertainty**, test the riskiest first.

□ Writing Strong Hypotheses

Weak: "Users will like dark mode." **Strong:** "If we add dark mode for Android users, D7 retention will increase by 3% within 4 weeks, because users read at night."

Format: **IF [change] THEN [metric moves by X] BECAUSE [reason], MEASURED BY [test] WITHIN [time].**

□ MVP Types — Pick by Risk

MVP Type	Best For	Example
Prototype	Test clarity / flow	Figma clickable
Concierge	Validate value deeply (humans do it manually)	Early Zomato agents calling restaurants
Wizard of Oz	Front-stage real, backstage fake	Fake "AI" that's a human
Fake Door	Test demand — clickable button, no real feature	"Coming soon" landing
Smoke Test	Ad or landing page to gauge intent	Launch page with sign-up
Single-Feature MVP	Ship 1 feature end-to-end	First Instagram = photos + filters only
Crippled MVP	Real product, limited scope	Uber in 1 city

□ Experiment Plan Template

1. Hypothesis
2. Success criteria (numeric)
3. Kill criteria
4. Method (MVP type)
5. Sample size & duration
6. Owner & stakeholders
7. Risks to users (ethics check)

□ Ethics of Testing

- Don't harm users (deceptive or financially risky tests).
- Respect privacy (don't log PII without consent).
- Don't break promises (fake-door: users who clicked "buy" must get a graceful "coming soon").

□ Key Terms

- **Assumption:** a belief not yet tested.
- **Hypothesis:** a testable prediction.
- **MVP:** Minimum Viable Product — smallest thing that tests the risk.
- **Pivot:** change direction based on evidence.
- **Desirability / Feasibility / Viability:** the 3 risks.

□ How It Connects

Discovery → produces evidence → feeds Prioritization → enters PRD → goes through Delivery.

⚠ Where Students Lose Marks

- Building MVPs that test everything (= not minimum).
- Hypotheses without numbers or time.

- Skipping the 3 risk dimensions.

□ If You Only Remember 3 Things

1. 3 risks: Desirability, Feasibility, Viability.
2. MVP type = the lightest test for the riskiest assumption.
3. Hypothesis: IF → THEN → BECAUSE → BY WHEN.

Topic 11: Prioritization, Stakeholders & Decision Memos □□

□ Understand It (The "Why")

A PM's backlog has 200 ideas and capacity for 5. How do you pick? That's prioritization. And every prioritization decision *must* survive a roomful of stakeholders (sales wants feature X, engineering wants refactor Y, CEO wants moonshot Z). **Decision memos** are how PMs win those rooms without politics.

□ RICE Scoring

$$\text{RICE} = (\text{Reach} \times \text{Impact} \times \text{Confidence}) / \text{Effort}$$

- **Reach:** users affected per period (e.g., 10,000/mo).
- **Impact:** 0.25 (minimal) / 0.5 / 1 / 2 / 3 (massive).
- **Confidence:** % (high=100, medium=80, low=50).
- **Effort:** person-months.

Example: | Feature | R | I | C | E | RICE | |---|---|---|---|---| | Dark Mode | 50,000 | 0.5 | 80% | 1 | 20,000 |
| One-Click Reorder | 30,000 | 2 | 100% | 2 | 30,000 | | AI Chatbot | 80,000 | 1 | 50% | 8 | 5,000 | → Ship
One-Click Reorder first.

□ Impact × Effort 2×2 (for early-stage)

	Low Effort	High Effort
High Impact	QUICK WINS	BIG BETS
Low Impact	FILL-INS	TIME SINKS (kill)

□ Kano Model

Delighters (unexpected joy)
↑
Performance (more = better, linear)
↓
Must-Haves (absence = anger)
↓
Indifferent / Reverse (avoid)

- Must-haves: basic expectations (app doesn't crash).
- Performance: faster delivery = happier.
- Delighters: free dessert with order — surprise!

- Delighters become Must-haves over time (it's a treadmill).

□ WSJF (Weighted Shortest Job First — SAFe)

$WSJF = (User\ Value + Time\ Criticality + Risk/Opp\ Enablement) / Job\ Size$

Used in enterprise / SAFe environments.

□ MoSCoW

- **M**ust have
- **S**hould have
- **C**ould have
- **W**on't have (this round)

□ Stakeholder Mapping — Power/Interest Grid

	Low Interest	High Interest
High Power	KEEP SATISFIED	MANAGE CLOSELY
Low Power	MONITOR	KEEP INFORMED

- **Manage closely:** your CEO, key engineering lead.
- **Keep satisfied:** a VP who cares occasionally.
- **Keep informed:** support/ops teams.
- **Monitor:** peripheral groups.

□ DACI vs RACI

Role	DACI (decisions)	RACI (execution)
D / R	D river — runs the process	R esponsible — does the work
A	A pprover — yes/no	A ccountable — owns outcome
C	C ontributor	C onsulted
I	I nformed	I nformed

Rule: use DACI for decisions, RACI for execution.

□ The 4 Difficult Stakeholder Archetypes

1. **The HiPPO** (Highest Paid Person's Opinion) — overrules with authority; counter with data.
2. **The Blocker** — finds risks everywhere; include early, give role.
3. **The Scope-Creeper** — keeps adding; use kill criteria + written scope.
4. **The Ghost** — silent until late, then explodes; force written sign-off.

□ The One-Page Decision Memo (Amazon-style)

```
TITLE: [Decision needed – one line]
CONTEXT: Why now? Data? 3 bullets.
OPTIONS: A / B / C + tradeoffs
RECOMMENDATION: We should do X, because...
RISKS + MITIGATIONS
ASK: Approval / budget / resources
```

Amazon famously *bans PowerPoint* inside — they force written 6-pagers for this reason.

□ Key Terms

- **RICE / WSJF / Kano / MoSCoW** — above.
- **Backlog grooming:** re-ranking backlog regularly.
- **DACI / RACI:** decision/execution frameworks.
- **HiPPO:** Highest Paid Person's Opinion.
- **Pre-wiring:** aligning stakeholders *before* the meeting.

□ How It Connects

Prioritization uses metrics + discovery inputs → selected items enter OKRs + PRDs → stakeholders hold PM accountable via decision memos.

⚠ Where Students Lose Marks

- Confusing DACI and RACI.
- Using one framework where another fits (RICE for innovation = bad; use Kano).
- Writing memos without kill criteria + clear ask.

□ If You Only Remember 3 Things

1. $RICE = (R \times I \times C) / E$.
2. Kano: Must-have → Performance → Delighter (delighters decay).
3. Decision memo: Context → Options → Recommendation → Ask.

Topic 12: OKRs (Objectives & Key Results) □

□ Understand It (The "Why")

Google used OKRs to grow from a dorm project to a trillion-dollar company. An **OKR** is a simple contract: *Objective* = what you want to achieve; *Key Results* = 3–5 measurable outcomes that prove you did it. OKRs replace vague goals with testable ones.

□ The OKR Format

□ Example — Swiggy PM OKR (Q2)

Objective: Make Swiggy the fastest food delivery in metro India. - **KR1:** Reduce avg delivery time from 32 → 25 min. - **KR2:** Lift D30 retention from 42% → 50%. - **KR3:** Keep delivery partner earnings ≥ ₹25,000/mo in 90% of cases.

□ Rules for OKRs

1. **3–5 Objectives** max (any more = not priorities).
2. **3–5 KRs per Objective.**
3. KRs are **outcomes, not activities** (not "ship feature X").
4. **70% attainment = success.** Hitting 100% = you sandbagged.
5. **Cadence:** quarterly (product) or annual (company).
6. **Aligned top-down AND bottom-up.**

□ OKRs vs KPIs vs Goals

Concept	Purpose
KPI	Ongoing health metric (always-on)
OKR	Time-bound change goal
Goal	Any aspiration

□ Common OKR Mistakes

- Writing tasks disguised as KRs ("Launch dark mode").
- Too many OKRs → loss of focus.
- Making them sandbaggy (too easy).
- No mid-quarter review.
- Cascading = copy-paste top-down (should be negotiated).

□ Key Terms

- **Aspirational/Stretch OKR:** 70% = good.
- **Committed OKR:** 100% expected.
- **Grading:** 0.0–1.0 per KR.
- **Cascading:** org levels align OKRs.

□ How It Connects

OKRs operationalize **Strategy** → prioritize **Backlog** → guide **PRD scope** → measured via **Metrics dashboards**.

⚠ Where Students Lose Marks

- KRs that are tasks, not outcomes.
- Forgetting 70% = success for stretch OKRs.
- Confusing OKRs with KPIs.

□ If You Only Remember 3 Things

1. Objective = direction; KRs = measurable outcomes.
2. KRs are outcomes, never activities.
3. Stretch OKR: hitting 70% = winning.

Topic 13: PRDs, UX Collaboration & Quality □

□ Understand It (The "Why")

A **PRD (Product Requirements Document)** is the PM's blueprint — the single source of truth that aligns product, design, engineering, QA, marketing. A good PRD cuts weeks of re-work.

□ PRD Structure (Modern, Lightweight)

1. Problem (why this matters)
2. Users & JTBD (who + what job)
3. Goals & Non-goals (in-scope vs out-of-scope)
4. Success metrics (OKR / KPI link)
5. Context & Research (evidence)
6. Proposed solution (flows, wireframes)
7. Requirements (user stories / acceptance criteria)
8. Edge cases & errors
9. Analytics & instrumentation
10. Launch plan (rollout, experiment)
11. Risks & dependencies
12. Open questions

□ User Story Format

As a [user type], I want to [action], so that [benefit].

Each story gets **Acceptance Criteria** (Given / When / Then):

Given I am logged in, When I click "Reorder," Then my last order should re-populate the cart within 2 seconds.

□ Non-Goals

Say what you are *not* doing. Protects scope.

□ UX Collaboration Loop

PM	→ problem framing + success metric
Designer	→ flows + wireframes + visual
Engineer	→ feasibility + tech design
QA	→ test plan + edge cases
PMM	→ launch narrative
	↑ (tight, iterative)

□ Laws of UX to Know

- **Hick's Law:** more choices = slower decision.
- **Fitts's Law:** closer/bigger targets are easier.
- **Jakob's Law:** users prefer patterns they know from other apps.
- **Miller's Law:** ~7 items in working memory.
- **Aesthetic-Usability:** pretty things *feel* more usable.

□ Quality Gates & Definition of Done (DoD)

DoD: code reviewed, unit + integration tests passing, design reviewed, analytics instrumented, accessibility checked, docs updated, feature-flag wired, rollout plan approved.

□ Accessibility (a11y)

- Color contrast ratios (WCAG AA).
- Keyboard navigable.
- Screen-reader labels.
- Touch targets $\geq 44\text{px}$.

□ Key Terms

- **PRD / BRD / MRD:** Product / Business / Market Requirements Document.
- **Spec / Epic / Story / Ticket:** hierarchy of work items.
- **User story + acceptance criteria.**
- **DoD / DoR:** Definition of Done / Ready.
- **Wireframe / Mockup / Prototype:** lo-fi → hi-fi → interactive.

□ How It Connects

PRD takes inputs from Discovery + Prioritization + OKRs → hands off to Delivery → closes with Post-Launch metrics.

⚠ Where Students Lose Marks

- PRDs without success metrics or non-goals.
- User stories without acceptance criteria.
- Ignoring edge cases + error states.

☐ If You Only Remember 3 Things

1. PRD answers: problem, users, goals, solution, metrics, risks.
2. Story = As a , *I want* , so that ____ + acceptance criteria.
3. Define non-goals to protect scope.

Topic 14: Delivery, Releases, Feature Flags, Experiments & Ops ☐

☐ Understand It (The "Why")

Writing a PRD is easy. Getting code safely to millions of users is hard. **Delivery** is the art of shipping predictably: agile, releases, feature flags, monitoring, incidents, rollbacks.

☐ Agile Delivery Loop

```
graph LR; Plan --> Build --> Test --> Release --> Measure --> Retro --> Plan; Retro --> Plan
```

Scrum: 2-week sprints, daily standup, review, retro. **Kanban:** continuous flow, WIP limits, cycle time.

☐ Estimation

- **Story points** (Fibonacci: 1, 2, 3, 5, 8, 13) — relative, not hours.
- **Velocity:** story points per sprint.
- **T-shirt sizing:** S / M / L / XL for early ideas.
- **Forecasting:** Monte Carlo (probability ranges, not single-point dates).

☐ Release Strategies

Strategy	How	Risk
Big bang	All users at once	High
Canary	1% → 5% → 25% → 100%	Low
Blue-green	Two envs, switch traffic	Low (rollback = flip)
Ring deployment	Internal → beta → GA	Low
Dark launch	Code on, feature off	Very low

□ Feature Flags

A **feature flag** (or toggle) is a config switch that turns a feature on/off without redeploy. Types: - **Release flags** (temporary — ship dark, enable later). - **Experiment flags** (A/B tests). - **Permission flags** (paid tier only). - **Ops/Kill switches** (emergency off). **Hygiene:** name clearly, document owner, set expiry, clean up.

□ Rollback Plan

Every launch must answer: "If this breaks at 3 am, what do we do?" Answer = flip the flag or revert the deploy.

□ Monitoring & SLIs/SLOs/SLAs

- **SLI (Service Level Indicator):** what you measure (latency, errors).
- **SLO (Objective):** target (99.9% uptime).
- **SLA (Agreement):** contractual (customer guarantee, usually lower than SLO).
- **Error budget:** 100% – SLO = how much unreliability you can afford before pausing launches.

□ Incident Response

1. **Detect** (monitoring alert).
2. **Declare** severity (SEV1 / SEV2 / SEV3).
3. **Mitigate** first, fix later (rollback, flag).
4. **Communicate** (status page, Slack channel, customer notice).
5. **Postmortem** — blameless: what happened, timeline, root cause, action items. **5-Whys** to find root cause.

□ Experimentation Ops

- Experiment platform (GrowthBook, Optimizely, in-house).
- Sample ratio mismatch (SRM) checks.
- Holdout groups (to measure long-term).
- Global control (baseline).
- Traffic caps per test.

□ Key Terms

- **CI/CD:** continuous integration / delivery.
- **DORA metrics:** deployment frequency, lead time, MTTR, change failure rate.
- **MTTR:** Mean Time To Recovery.
- **SEV1/2/3:** severity levels.
- **Blameless postmortem.**
- **Canary / Blue-green / Ring / Dark launch.**

□ How It Connects

Delivery executes PRDs → feature flags enable experiments → monitoring produces metrics → incidents feed retros → retros improve discovery.

⚠ Where Students Lose Marks

- Forgetting rollback plan.
- Confusing SLO with SLA.
- Making postmortems blame-ful.
- Not cleaning up feature flags.

□ If You Only Remember 3 Things

1. Canary + feature flag + rollback = safe release.
2. SLI measured, SLO target, SLA contract.
3. Postmortems are blameless and action-oriented.

Topic 15: Enterprise, Platform & API Product Management □

□ Understand It (The "Why")

Selling to a consumer (you installing PhonePe) is different from selling to Infosys buying Salesforce. Enterprise PM = many personas, long sales cycles, security, compliance, SLAs. Platform/API PM = you are the product for *developers* — DX (developer experience) is your UI.

□ Enterprise vs SMB vs Consumer

	Consumer	SMB	Enterprise
Buyer	User = buyer	Owner	Committee
Cycle	Minutes	Weeks	6–18 months
Contract	Click-through	Self-serve+	Negotiated
Support	Self-serve	Email	Dedicated CSM
Pricing	Fixed	Tiered	Custom

□ The Enterprise Buying Committee

- **Champion** — the believer inside.
- **Economic Buyer** — CFO / CEO.
- **User** — who actually uses it.
- **Technical Evaluator** — IT / architect.
- **Procurement** — legal / purchasing.
- **Security / Compliance** — review gate.

□ Enterprise Deal Stages

Prospect → Discovery → Demo → POC → Proposal → Negotiation → Close → Onboard → Expand

□ Platform Product Principles

- **Backward compatibility** is sacred.
- **Versioning** (v1, v2 — never breaking v1 customers).
- **Deprecation policy** (advance notice, migration support).
- **Ecosystem thinking**: you succeed when your developers succeed.

□ API Product Checklist

1. Clear docs + quickstart.
2. Authentication (OAuth, API key).
3. Rate limits + predictable errors.
4. SDKs in top languages.
5. Sandbox + test credentials.
6. Changelog + semver.
7. SLAs + uptime.
8. Pricing (freemium tier, usage-based).

□ DX Metrics (Developer Experience)

- Time-to-first-hello-world.
- Time-to-first-API-call.
- Docs satisfaction.
- Support ticket ratio per user.

□ Key Terms

- **SSO**: Single Sign-On.
- **RBAC**: Role-Based Access Control.
- **SOC 2 / ISO 27001 / GDPR**: compliance certifications.
- **SLA**: uptime contract.
- **POC (Proof of Concept)**: time-boxed eval.
- **ABM**: Account-Based Marketing.
- **Champion / Economic buyer**.
- **Semver**: semantic versioning (major.minor.patch).

□ How It Connects

Enterprise ties back to **Positioning** (segment-specific), **Pricing** (custom/negotiated), **GTM** (sales-led), **Delivery** (SLAs).

⚠ Where Students Lose Marks

- Treating enterprise like consumer.
- Ignoring compliance / security.
- Forgetting backward compatibility in APIs.

□ If You Only Remember 3 Things

1. Enterprise = committee sale + long cycle + compliance.
2. APIs are products; DX is their UI.
3. Never break backward compatibility without deprecation notice.

Topic 16: GTM, PMF, Growth & Post-Launch □□□

□ Understand It (The "Why")

Building a product is half the game. The other half is **Go-To-Market (GTM)** — getting the right users, at the right price, through the right channels, with the right message. Post-launch, you enter the world of **Growth** — compounding acquisition, retention, expansion.

□ GTM vs Marketing vs Product Strategy

	Scope
Product Strategy	What we build and why
Marketing Strategy	How we tell the world forever
GTM Strategy	How we launch a specific product/feature to a specific segment

□ GTM 5 Core Components

1. Target Customer (ICP / Persona)
2. Value Proposition (Positioning + Message)
3. Pricing & Packaging
4. Channels (sales motion, marketing mix)
5. Success Metrics (launch + post-launch)

□ Product-Led vs Sales-Led GTM

	PLG (Product-Led)	SLG (Sales-Led)
Who converts	Product itself	Sales team
Example	Slack, Figma, Notion	Salesforce, Oracle
Entry	Self-serve free	Demo + POC
Cost	Low CAC	High CAC
Expansion	In-product	AEs upsell

□ Product-Market Fit (PMF)

Definition: **You have PMF when the market is pulling the product out of your hands.**

Sean Ellis Test: Ask users *"How would you feel if you could no longer use this product?"* — **if $\geq 40\%$ say "very disappointed," you have PMF.**

Signals: - Retention curve flattens (not zero). - Organic growth > paid. - High NPS (50+). - Users tell friends. - Demand exceeds supply.

□ The Retention Curve

□ Launch Tiers

Tier	Scope	Example
Tier 1	Big bet — company moment	New product line
Tier 2	Major feature	Swiggy Genie
Tier 3	Incremental	Small UX tweak

□ Launch Playbook (Pre/During/Post)

Pre-Launch (T-6 weeks → T-0): - Readiness checklist (support, docs, legal, analytics). - Build anticipation (teasers, beta, PR). - Sales enablement (battle cards). **Launch Day:** - Announcement (blog, email, social, press). - Flip the flag; monitor dashboards. - Incident war room ready. **Post-Launch (T+1 → T+12 weeks):** - Metrics review (activation, retention). - Win/Loss analysis. - Iterate based on feedback.

□ Growth Flywheel (Amazon's classic)

□ Unit Economics

Metric	Formula
CAC	\$ spent / new customers
LTV	ARPU × gross margin × (1/churn)
LTV/CAC	ratio; > 3 healthy
Payback	CAC / (ARPU × margin) — target < 12 mo
ARPU	MRR / users
Gross margin	(Rev – COGS) / Rev

□ Viral Loops & K-Factor

$K = (\text{invites sent per user}) \times (\text{conversion rate of invite})$ — $K > 1$ = viral growth.

□ Retention Lifecycle

Acquire → Activate → Engage → Retain → Expand → Advocate → (Referral)

□ Churn Prevention

- Early-warning: drop in usage frequency.
- Onboarding: strong first 7 days.
- Success team: check-ins for enterprise.
- Win-back: discounts + personal outreach.

□ Win/Loss Analysis

Interview recent wins AND losses. Ask: What triggered evaluation? Who else did they consider? Why did we win/lose? — feeds positioning, product, pricing.

□ International Expansion

Localize: language, currency, payments, regulations, content, support hours, cultural fit (not just translate).

□ Key Terms

- **GTM, PMF, PLG, SLG.**
- **CAC / LTV / Payback / ARPU.**
- **K-factor (viral coefficient).**
- **North Star Metric.**
- **Cohort retention.**
- **Expansion / Net revenue retention (NRR > 100% = growing without new sales).**
- **Battle card** — sales tool to fight competitors.
- **ABM** — Account-Based Marketing.
- **Attribution model** — last-click, first-click, multi-touch.
- **Demand gen** — top-of-funnel pipeline building.

□ How It Connects

GTM is the destination every other topic feeds into. Strategy → Segmentation → Positioning → Pricing → PRD → Delivery → GTM → Growth → back to Discovery.

⚠ Where Students Lose Marks

- Confusing GTM with marketing.
- Claiming PMF without retention flattening.
- Treating PLG as "no salespeople" (it's product-led, not salesperson-less).
- Forgetting LTV/CAC > 3 rule.

□ If You Only Remember 3 Things

1. GTM = ICP + Value Prop + Pricing + Channels + Metrics.
 2. PMF = Sean Ellis ≥ 40% + retention flattening.
 3. LTV/CAC > 3 & payback < 12 months = healthy growth.
-

Topic 17: Amazon Buy-Now Case (Filled Example) — How All Of This Looks In Practice

□ Understand It

The Buy-Now deck is a *filled example* of what a PM actually produces on a real initiative: delivery-ops plan, release plan, feature-flag strategy, monitoring, experimentation ops, cross-functional plan, closing. It's the "integrated" version of Topics 10–14 combined.

□ Integrated Initiative Structure

1. Problem/Context
2. Delivery Ops: sizing, capacity, risks, dependencies, cadence
3. Release Plan: phases, rollout %, gating metrics
4. Feature Flags & Config: flag names, owners, rollback
5. Monitoring: dashboards, SLIs, alerts
6. Experimentation Ops: A/B design, MDE, guardrails
7. Cross-Functional Ops: RACI, communication plan
8. Launch readiness + closing

□ If You Only Remember 3 Things

1. Real PM work = integrated plan (delivery + release + flags + monitoring + experiment).
 2. Every flag has an owner, an expiry, and a rollback.
 3. Ops cadence = Mon (delivery) / Tue (dependencies) / Wed (analytics) / Thu (readiness) / Fri (risk review).
-

⚡ Master Cheat Sheet (5-Minute Pre-Exam Read)

Core PM Identity

- **PM = User × Business × Tech.** Outputs ≠ Outcomes. Lead with influence + evidence.
- **PM vs PO vs PMM** = Why/What vs Backlog vs Launch/Positioning.

Product Thinking

- **JTBD:** When [situation], I want to [motivation], so I can [outcome]. Functional + Emotional + Social jobs.

Market & Customer

- **TAM ⊃ SAM ⊃ SOM** — bottom-up: users × frequency × price.
- **ICP** = B2B company profile; **Persona** = individual archetype.

Positioning

- For [X] who [Y], we are [Z] that [benefit], unlike [A], because [B].
- **2×2 matrix** on the two axes that matter to the user.
- **SWOT + Porter's 5 Forces.**

Research

- **Qual = Why** (5 users catches 80%); **Quant = What** (n ≥ 385 for 95%).
- Ask past behavior, not future intent. Mom Test.
- Affinity → themes → insights (pattern that changes decision).

Metrics

- **North Star Metric:** one number that captures core value.
- **AARRR:** Acquisition, Activation, Retention, Referral, Revenue.
- **HEART:** Happiness, Engagement, Adoption, Retention, Task success.
- **LTV/CAC > 3; Payback < 12 mo; NRR > 100%.**
- **DAU/MAU = stickiness.**
- **A/B test:** Hypothesis → MDE → sample size → run → analyze, no peeking, check guardrails, SRM.

Discovery

- 3 risks: **Desirability, Feasibility, Viability.**
- Hypothesis: **IF → THEN → BECAUSE → BY WHEN.**
- **MVP types:** Prototype, Concierge, Wizard-of-Oz, Fake-door, Smoke, Single-feature, Crippled.

Prioritization

- **RICE** = (R × I × C) / E.
- **Kano:** Must-have / Performance / Delighter (decays).
- **WSJF** = (Value + Time-crit + Risk) / Size.

- **MoSCoW:** Must / Should / Could / Won't.
- **Impact × Effort 2×2:** Quick wins / Big bets / Fill-ins / Time sinks.

Stakeholders

- **Power–Interest grid:** Manage closely / Keep satisfied / Keep informed / Monitor.
- **DACI** (decisions): Driver, Approver, Contributor, Informed.
- **RACI** (execution): Responsible, Accountable, Consulted, Informed.
- **HiPPO** = Highest Paid Person's Opinion — counter with data.

Decision Memo

Context → Options → Recommendation → Risks/Mitigations → Ask.

OKRs

- **O** = qualitative ambition. **KRs** = 3–5 measurable outcomes (not activities).
- **70% stretch attainment = success.**

PRDs

- Problem → Users/JTBD → Goals/Non-goals → Metrics → Solution → Stories + Acceptance → Edges → Analytics → Launch → Risks.
- **Story:** As a , *I want* , so that ____.

Delivery

- Scrum vs Kanban. Velocity = story points / sprint.
- Release: Canary, Blue-green, Ring, Dark launch.
- Feature flags: release / experiment / permission / kill.
- **SLI < SLO < SLA.** Error budget = 100% – SLO.
- Incident: Detect → Declare → Mitigate → Communicate → Postmortem (blameless, 5-whys).

Pricing

- **Model / Pricing / Packaging** (3 layers).
- Strategies: Cost-plus / Competitor / **Value-based** / Penetration / Premium / Dynamic / Hybrid.
- 3 tiers (Good/Better/Best). Freemium: free = real value, paid = 10×.
- Psychology: anchoring, decoy, charm, framing.

Strategy

- Vision > Mission > Strategy > OKRs > Initiatives > Features.
- Business case ends in **Kill Criteria**.
- **3 Horizons:** 70/20/10.

Enterprise / API

- Committee: Champion, Economic buyer, User, Tech, Procurement, Security.
- APIs: backward compatible, semver, docs, sandbox, rate limits.

GTM & Growth

- **5 GTM components:** ICP / Value prop / Price / Channels / Metrics.
- **Sean Ellis PMF:** $\geq 40\%$ "very disappointed" without product.
- **Retention curve flattens = PMF.**
- **K-factor > 1 = viral.**
- **Growth flywheel; Win/Loss analysis.**

□ How Everything Connects (Concept Map)

Feed-loop shortcuts: - Research feeds Discovery, Prioritization, Positioning. - Metrics feed Discovery (what to test), OKRs (what to move), and Kill Criteria. - Incidents feed Retros feed next Sprint planning. - Win/Loss feeds GTM + Positioning + Pricing.

□ 25 Exam Questions — With Full Answers

Q1. What is Product Management in one line?

Answer: Product Management is the discipline of deciding *what* to build, *for whom*, *why*, and *when*, to create real user value and sustainable business outcomes, by working at the intersection of user desirability, business viability, and technical feasibility — leading through influence and evidence rather than authority. **Keywords:** user desirability, business viability, tech feasibility, outcomes over outputs, influence.

Q2. Outputs vs Outcomes — distinguish with examples.

Answer: Outputs are things shipped (a feature, a launch, lines of code). Outcomes are changes in user or business behavior (retention up, revenue lifted, NPS improved). Example: *Output* — launched "dark mode"; *Outcome* — 12% increase in night-time sessions. A good PM optimizes for outcomes because outputs can be busy work without value. **Keywords:** output = shipped, outcome = behavior change, busy work, measurable impact.

Q3. What is Jobs-To-Be-Done? Give a Swiggy example.

Answer: JTBD is a framework that reframes user needs as "jobs" they hire products to perform, in a specific situation and motivation, to get a desired outcome. Example: *"When I'm hungry and lazy on a Sunday, I want to order food in under 30 minutes, so I can eat without leaving my couch."* Swiggy is "hired" for this job; DIY cooking and dining out are competitors for the same job. **Keywords:** situation, motivation, outcome, functional/emotional/social jobs.

Q4. Explain TAM, SAM, SOM with an example.

Answer: TAM (Total Addressable Market) = all possible demand globally. SAM (Serviceable Addressable Market) = portion you can realistically serve given your geography and product. SOM (Serviceable Obtainable Market) = share you can capture in 1–3 years. Example (Indian EdTech): TAM = ₹3 lakh cr (all K-12 education); SAM = ₹60,000 cr (online K-12 tutoring in Tier-1/2); SOM = ₹5,000 cr (realistic capture in 3 years). Bottom-up: #students × subscription × conversion. **Keywords:** total, serviceable, obtainable, bottom-up, nested circles.

Q5. Write a positioning statement for CRED.

Answer: *For affluent Indian credit-card holders (ICP) who want an effortless, rewarding way to pay their bills (need), CRED is a credit-card-payment and rewards platform (category) that turns bill payments into an elite, gamified experience with premium rewards (benefit), unlike generic bank apps and wallets (alternatives), because CRED is invite-only and curates luxury partners (differentiator).* **Keywords:** target, need, category, unique benefit, unlike, because.

Q6. What is the Sean Ellis PMF test, and what else signals PMF?

Answer: The Sean Ellis test asks users *"How would you feel if you could no longer use this product?"* — if ≥ 40% answer "very disappointed," you have product-market fit. Other signals: retention curve flattens (users stay), organic growth outpaces paid, NPS is 50+, demand exceeds supply, and users refer others spontaneously. **Keywords:** 40%, very disappointed, retention flattening, organic growth.

Q7. Differentiate qualitative and quantitative research.

Answer: Qualitative research answers *why* with deep insight from small samples (5–10 interviews, ethnography); quantitative answers *what* with statistical rigor from large samples (surveys, analytics). Qual inspires hypotheses; quant validates them. A strong PM workflow runs qual first (to discover), then quant (to confirm at scale). **Keywords:** why vs what, small vs large, inspire vs validate, hypothesis generation vs testing.

Q8. Explain RICE with a worked example.

Answer: $RICE = (Reach \times Impact \times Confidence) / Effort$. Example: "Add one-click re-order": Reach = 30,000 users/mo, Impact = 2 (high), Confidence = 100%, Effort = 2 person-months → RICE = 30,000. Compared against "AI chatbot": R=80,000, I=1, C=50%, E=8 → RICE = 5,000. One-click re-order wins despite smaller reach because impact is high, confidence is certain, and effort is low. **Keywords:** Reach, Impact, Confidence, Effort, formula, comparative scoring.

Q9. What is the Kano Model?

Answer: The Kano model classifies features by the emotional response they elicit: **Must-haves** (their absence angers users; presence is expected, e.g., app doesn't crash), **Performance** (more is better, linearly — e.g., faster delivery), **Delighters** (surprise joy that boosts satisfaction disproportionately — e.g., free dessert). Delighters decay into performance and then must-haves over time — a treadmill of expectation. **Keywords:** must-have, performance, delighter, decay, expectation treadmill.

Q10. DACI vs RACI — when do you use which?

Answer: DACI clarifies **decision** roles (Driver-Approver-Contributor-Informed) and is used when a specific decision must be made. RACI clarifies **execution** roles (Responsible-Accountable-Consulted-Informed) and is used when running a project or ongoing operation. Rule of thumb: DACI for the meeting where we pick the path; RACI for the weeks where we walk it. **Keywords:** decisions vs execution, Driver vs Responsible, Approver vs Accountable.

Q11. Write an OKR for a Zomato PM.

Answer: Objective: Make Zomato the most trusted place to discover great restaurants in India. - **KR1:** Raise weekly active reviewers from 1.2M → 1.8M. - **KR2:** Improve review quality score (photos + text length) from 3.4 → 4.0. - **KR3:** Reduce time-to-first-review after signup from 11 days → 5 days. **Keywords:** ambitious objective, measurable outcomes (not activities), 3–5 KR's, time-bound.

Q12. Explain North Star Metric. Pick one for Flipkart.

Answer: The North Star Metric is the single number that best captures the core value your product delivers to customers; it aligns teams and cascades into input metrics. For Flipkart, a strong NSM is **"successful orders delivered per month"** — it captures both demand (orders) and fulfillment (successful delivery), unlike "GMV" which is vanity or "signups" which is shallow. Input metrics: catalog depth, conversion, delivery SLA, return rate. **Keywords:** one metric, core value, alignment, input metrics, vanity vs actionable.

Q13. AARRR — explain with a PhonePe example.

Answer: AARRR tracks the user lifecycle: **Acquisition** (PhonePe ad → install), **Activation** (first UPI transaction), **Retention** (repeat transaction within 30 days), **Referral** (invite a friend via shared link), **Revenue** (merchant fees, gold, insurance upsell). Each stage gets a metric; dropoffs reveal where to invest. **Keywords:** Acquisition, Activation, Retention, Referral, Revenue, funnel, dropoff.

Q14. Design an A/B test for a Swiggy "Re-order" button.

Answer: - **Hypothesis:** Showing a "Re-order your last" button on the home screen will lift 7-day repeat-order rate by 3%, because users are lazy decision-makers. - **Primary metric:** repeat-order rate within 7 days. - **Guardrails:** overall conversion, avg order value, support tickets, crash rate. - **Variants:** Control (no button) vs Treatment (button). - **Randomization:** user-level, 50/50. - **Sample size:** based on MDE 3%, power 0.8, α 0.05 → e.g., 40,000 users/arm. - **Duration:** 14 days (capture weekend + weekday). - **Checks:** Sample Ratio Mismatch, no peeking. - **Decision:** ship if primary lift significant and no guardrail regresses. **Keywords:** hypothesis, MDE, guardrails, randomization, sample size, SRM, no peeking.

Q15. What are MVP types and how do you pick?

Answer: MVP types: **Prototype** (test clarity), **Concierge** (humans deliver manually for deep value test), **Wizard of Oz** (real front, fake back), **Fake door** (clickable button with no feature), **Smoke test** (landing page + ad), **Single-feature MVP** (ship one feature end-to-end), **Crippled** (real product, limited scope). Picking rule: match the lightest, cheapest test to the riskiest assumption. Desirability risk → fake door or smoke; value-depth risk → concierge; workflow risk → wizard of Oz. **Keywords:** risk-driven, lightest test, assumption mapping.

Q16. What is a Decision Memo and why use one (not slides)?

Answer: A decision memo is a one-page written document stating context, options, recommendation, risks, and the ask. Amazon famously uses narrative 6-pagers instead of slides. Written memos force clear thinking, prevent charisma-based decisions (HiPPO), give async stakeholders the same information, and create a durable record. Slides favor bullet fluency; memos favor logic. **Keywords:** context-options-recommendation-risks-ask, Amazon narrative, async, anti-HiPPO.

Q17. Explain the 3 risks in discovery.

Answer: Desirability (do users want this?), Feasibility (can we build it?), Viability (does it make business sense?). Every initiative has assumptions in all three; the riskiest one must be tested first with the lightest possible MVP. Example: building Ola Auto had high feasibility risk (driver supply) and viability risk (unit economics), low desirability risk (huge latent demand) — so early tests focused on driver onboarding, not user surveys. **Keywords:** desirability, feasibility, viability, assumption mapping, risk-driven testing.

Q18. What are feature flags and why are they important?

Answer: Feature flags are config switches that toggle features on/off without redeploy. Types: release (dark launch), experiment (A/B), permission (paid tier), kill-switch (emergency). They enable canary rollouts, instant rollback, experimentation, and decoupling deploy from release. Hygiene: name clearly, owner assigned, expiry set, cleaned up after use — zombie flags create tech debt. **Keywords:** toggle, canary, rollback, A/B, zombie flags, hygiene.

Q19. Differentiate SLI, SLO, SLA and explain error budget.

Answer: SLI is the measured indicator (e.g., availability %). SLO is the internal target (e.g., 99.9% uptime monthly). SLA is the contractual guarantee to customers (usually lower than SLO, e.g., 99.5% with credits on breach). **Error budget = 100% – SLO** — the allowed unreliability. If consumed, teams pause risky launches to restore reliability. This turns reliability into a first-class tradeoff, not a wish. **Keywords:** indicator, objective, agreement, error budget, reliability tradeoff.

Q20. Compare PLG vs SLG motions.

Answer: Product-Led Growth (PLG) lets the product sell itself via free/self-serve onboarding; users become buyers (Slack, Figma, Notion). Low CAC, fast conversion, needs strong UX and time-to-value. Sales-Led Growth (SLG) uses AEs, demos, POCs, negotiations (Salesforce, Oracle); high CAC, longer cycle, needed for complex enterprise buys. Many companies are hybrid: PLG for bottoms-up signups, SLG for expansion into enterprise. **Keywords:** self-serve, bottoms-up, AEs, POC, hybrid.

Q21. What is the difference between pricing and packaging?

Answer: Pricing answers "how much and on what metric" (e.g., ₹2,999/user/month). Packaging answers "what is included at this tier and what's gated behind the next tier" (e.g., Analytics in Growth tier; SSO in Enterprise). Pricing signals positioning; packaging engineers upgrade paths. Both sit inside a business model (how money flows) — you can change packaging without changing the model. **Keywords:** how much vs what's included, tiering, upgrade path, model vs pricing vs packaging.

Q22. Write a user story with acceptance criteria for a Zomato review feature.

Answer:

Story: As a Zomato user, I want to write a short review with photos after dining, so that I can share my honest experience and help others choose. **Acceptance criteria:** - Given a completed dine-in booking, When 2 hours have passed post check-in, Then the app sends a review-prompt notification. - Given the user taps the prompt, When they open the review screen, Then they can rate 1–5 stars, add up to 250 characters, and attach up to 4 photos (≤5MB each). - Given they submit, When validation passes, Then review is saved and visible in under 5 seconds, with a confirmation toast. - Given network failure, When submit fails, Then draft is saved locally and auto-retried. **Keywords:** As-a/I-want/So-that, Given-When-Then, edge cases (failure, validation).

Q23. You are PM at a startup with 200 ideas and capacity for 5. How do you prioritize?

Answer: Step 1: align all ideas to current OKRs — discard those that don't support objectives. Step 2: coarse-filter with Impact × Effort 2×2; park time-sinks, capture quick wins. Step 3: RICE-score the High-Impact shortlist for comparable items; use Kano for innovation-vs-hygiene mix. Step 4: sanity-check with stakeholders via a Power/Interest map; pre-wire HiPPOs. Step 5: write a one-page decision memo with the top 5, kill criteria, and ask; circulate before the meeting. **Keywords:** OKR alignment, 2×2 coarse filter, RICE, Kano, stakeholder pre-wire, decision memo.

Q24. You just launched a feature and retention dropped. What do you do?

Answer: (1) Confirm the signal — check for instrumentation bug, sample ratio mismatch, seasonality. (2) Segment — which cohort dropped (new vs returning, platform, geography)? (3) Diagnose — funnel drop-off analysis, qualitative calls with recent churners, support-ticket themes. (4) Decide — if guardrails breached, flip feature flag off (rollback); if partial issue, ship a hotfix; if acceptable trade-off, communicate. (5) Postmortem — blameless, 5-whys; update hypotheses and kill criteria. (6) Iterate with a corrected A/B test. **Keywords:** confirm, segment, diagnose, rollback via flag, postmortem, 5-whys.

Q25. What makes a great Product Manager?

Answer: A great PM combines (a) strategic thinking — connects user JTBD, market segment, and business model; (b) evidence-driven decisions — uses qual+quant research, hypothesis testing, and metrics; (c) communication — writes crisp PRDs and decision memos; (d) empathy and leadership — for users, designers, engineers, and stakeholders; (e) bias for outcomes over outputs. They operate the full loop: Discover → Define → Deliver → Measure → Learn. Most of all, they are willing to kill their own ideas when evidence says so. **Keywords:** strategy, evidence, communication, empathy, outcomes, kill own ideas.

□ 50 Flashcards (Last 30 Minutes Before Sleep)

Q1: What are the three lenses a PM balances? **A1:** User desirability, business viability, technical feasibility.

Q2: PM vs PO vs PMM? **A2:** PM = why/what; PO = backlog owner (Scrum); PMM = positioning + launch.

Q3: Output vs outcome? **A3:** Output = what was shipped. Outcome = behavior/result changed.

Q4: JTBD sentence format? **A4:** When [situation], I want to [motivation], so I can [outcome].

Q5: 3 layers of JTBD? **A5:** Functional, Emotional, Social.

Q6: TAM / SAM / SOM? **A6:** Total Addressable / Serviceable Addressable / Serviceable Obtainable.

Q7: Bottom-up market sizing formula? **A7:** Users × Frequency × Price.

Q8: ICP vs Persona? **A8:** ICP = B2B company profile; Persona = individual archetype.

Q9: Positioning statement template? **A9:** For [X] who [Y], we are [Z] that [benefit], unlike [A], because [B].

Q10: SWOT? **A10:** Strengths, Weaknesses, Opportunities, Threats.

Q11: Porter's 5 Forces? **A11:** New entrants, supplier power, buyer power, substitutes, rivalry.

Q12: Mom Test rule? **A12:** Ask about past behavior, not future intent.

Q13: How many users catch ~80% of usability issues? **A13:** 5 users.

Q14: Qualitative vs Quantitative? **A14:** Qual = why (small n); Quant = what (large n).

Q15: NPS formula? **A15:** % Promoters (9–10) – % Detractors (0–6).

Q16: DAU/MAU is called? **A16:** Stickiness.

Q17: North Star Metric? **A17:** The one number that captures core user value.

Q18: AARRR? **A18:** Acquisition, Activation, Retention, Referral, Revenue.

Q19: HEART? **A19:** Happiness, Engagement, Adoption, Retention, Task success.

Q20: Vanity vs actionable metric? **A20:** Vanity looks big but doesn't drive decisions; actionable moves with cause.

Q21: Leading vs lagging? **A21:** Leading predicts future; lagging confirms past.

Q22: A/B test significance threshold? **A22:** $p < 0.05$.

Q23: What's SRM? **A23:** Sample Ratio Mismatch — traffic split didn't match designed ratio.

Q24: LTV/CAC healthy ratio? **A24:** > 3 .

Q25: Payback period target? **A25:** < 12 months.

Q26: Sean Ellis PMF threshold? **A26:** $\geq 40\%$ "very disappointed" without product.

Q27: 3 risks in discovery? **A27:** Desirability, Feasibility, Viability.

Q28: Hypothesis format? **A28:** IF [change] THEN [metric] BECAUSE [reason] BY [when].

Q29: MVP for demand/intent signal? **A29:** Fake door.

Q30: MVP with humans behind the scenes? **A30:** Concierge / Wizard of Oz.

Q31: RICE formula? **A31:** $(\text{Reach} \times \text{Impact} \times \text{Confidence}) / \text{Effort}$.

Q32: Kano categories? **A32:** Must-have, Performance, Delighter.

Q33: WSJF formula? **A33:** $(\text{Value} + \text{Time-crit} + \text{Risk}) / \text{Size}$.

Q34: MoSCoW? **A34:** Must, Should, Could, Won't.

Q35: Power–Interest grid quadrants? **A35:** Manage closely, Keep satisfied, Keep informed, Monitor.

Q36: DACI letters? **A36:** Driver, Approver, Contributor, Informed.

Q37: RACI letters? **A37:** Responsible, Accountable, Consulted, Informed.

Q38: HiPPO? **A38:** Highest Paid Person's Opinion.

Q39: Decision memo structure? **A39:** Context → Options → Recommendation → Risks → Ask.

Q40: OKR KRs should be...? **A40:** Outcomes, not activities; measurable; 3–5 per objective.

Q41: Stretch OKR success threshold? **A41:** ~70% attainment.

Q42: User story format? **A42:** As a [X], I want [Y], so that [Z].

Q43: Acceptance criteria format? **A43:** Given / When / Then.

Q44: Release strategy with incremental rollout %? **A44:** Canary.

Q45: Code shipped but feature off? **A45:** Dark launch / feature flag.

Q46: SLI vs SLO vs SLA? **A46:** Indicator / Objective / Agreement (with customer).

Q47: Error budget formula? **A47:** 100% – SLO.

Q48: Pricing anchors (three main)? **A48:** Cost-plus, Competitor-based, Value-based.

Q49: 5 GTM core components? **A49:** ICP, Value prop, Pricing, Channels, Metrics.

Q50: K-factor viral threshold? **A50:** > 1 = viral growth.

□ Tonight's Study Order

Highest-weight topics (study first — 1.5 hrs)

1. **Metrics, North Star, AARRR, HEART, A/B Testing** (Topic 7) — appears in 5+ decks.
2. **GTM, PMF, Growth, Post-Launch** (Topic 16) — huge deck (212 slides).
3. **Prioritization (RICE/Kano/WSJF) + Stakeholders + Decision Memos** (Topic 11) — big session.
4. **Pricing, Packaging, Business Models** (Topic 9) — standalone deck.
5. **Delivery, Releases, Feature Flags, Incidents** (Topic 14) — 101 slides.

Medium-weight (next 1.5 hrs)

1. **Intro / PM identity + outputs vs outcomes** (Topic 1).
2. **Product Thinking / JTBD** (Topic 2).
3. **Customers + Market Sizing** (Topic 3).
4. **Positioning + Competitive** (Topic 4).
5. **Discovery / MVPs / Validation** (Topic 10).
6. **OKRs** (Topic 12).

Skim if time-poor (30 min)

1. **Qualitative Research** (Topic 5).
2. **Quant / Surveys** (Topic 6).
3. **Strategy / Business Case / Portfolio** (Topic 8).
4. **PRDs / UX / Quality** (Topic 13).
5. **Enterprise / Platform / API** (Topic 15).
6. **Amazon Buy-Now integrated example** (Topic 17).

Suggested Hour-by-Hour Plan (starting 8 pm)

Time	Activity
8:00–9:00	Read Big Picture + Topics 1, 2, 3. Take 5 min break.
9:00–10:00	Topics 4, 7 (Metrics is heavy — give it 40 min).
10:00–10:15	Break (walk, water).
10:15–11:15	Topics 10, 11 (discovery + prioritization).
11:15–12:15	Topics 9, 12, 14 (pricing + OKR + delivery).
12:15–12:45	Topics 13, 15, 16 (PRDs + Enterprise + GTM skim).
12:45–1:15	25 Exam Questions — write answers on paper.
1:15–1:45	Master Cheat Sheet + Concept Map.
1:45–2:15	50 Flashcards (cover, recall, flip).
2:15–2:30	Sleep. Seriously — sleep beats one more re-read.
Morning	15-min re-read of Cheat Sheet + Concept Map + weak flashcards.
